

# SUSTAINABILITY BY DESIGN

We are committed to incorporating the International Standard Organization's International Workshop Agreement [IWA] 42 guidelines.

Our primary accountabilities are to seek ways to address scope 3 emissions, as set out in ISO 14064-1, following the appropriate protocol set-out for each particular category:

For our next iteration our focus will be on elements identified as being reasonable to be addresses by Very Small Entities [VSEs] also know as micro businesses, specifically: 1, 2, 3, 5, 6, 7 and 15 above.

We will publish our targets and share in accordance with the guidance given in ISO's IWA 42 and ISO 14064-1:2019, such as:

**Redesigning and developing products and services to reduce their life cycle emissions**

**Promoting, supporting and facilitating the circular economy (e.g. reuse, repair, refurbishment, repurposing, recycling)**

**Collaborating with other organizations and sector or industry partners to strengthen and align procurement and purchase requirements**

**Prioritizing suppliers based on their climate strategy, past performance and transparency of emission data**

**Prioritizing low-carbon mobility solutions (e.g. public transport, electric vehicles with appropriate charging infrastructure) and reducing the need for personal transportation through urban planning**

**Ensuring financial investments, including assets and pension funds, are aligned with climate strategy and net zero commitments**
